

BUILDING IN PUBLIC

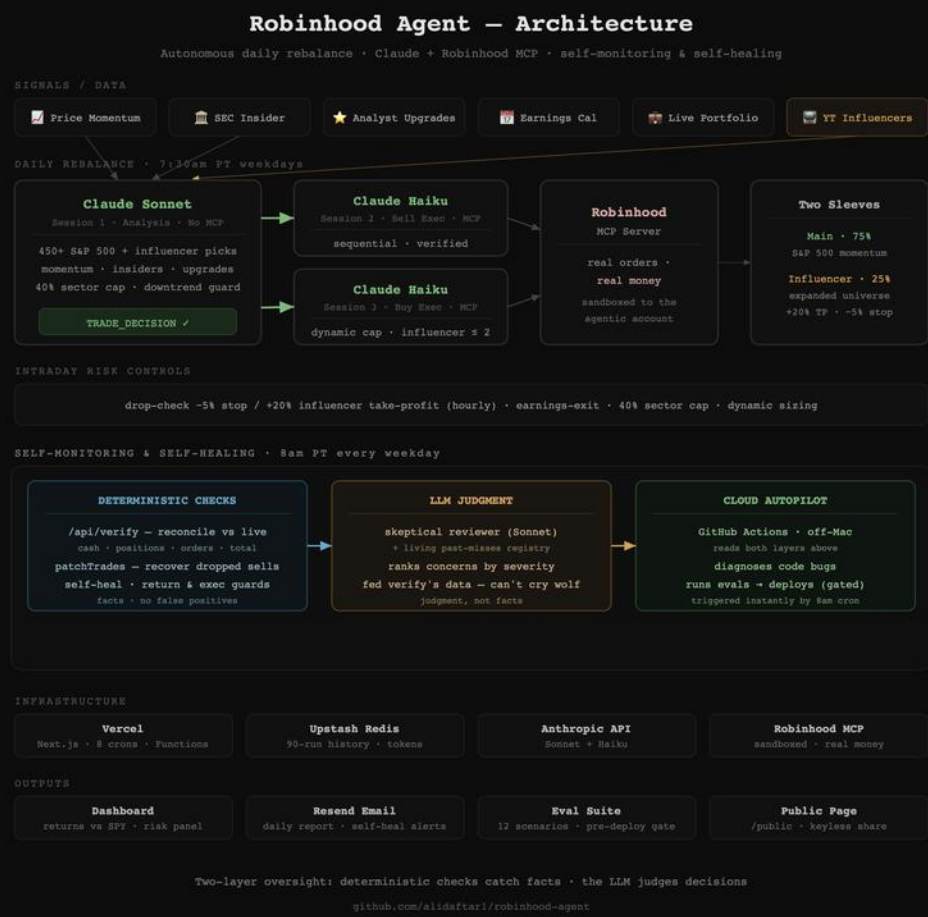

I let an AI trade a real Robinhood account.

Here's what I shipped – and what it taught me about where AI actually belongs.

swipe →

THE SYSTEM

Autonomous, self-monitoring, self-healing

Daily rebalance across two sleeves, then a two-layer oversight system checks its own work every morning.

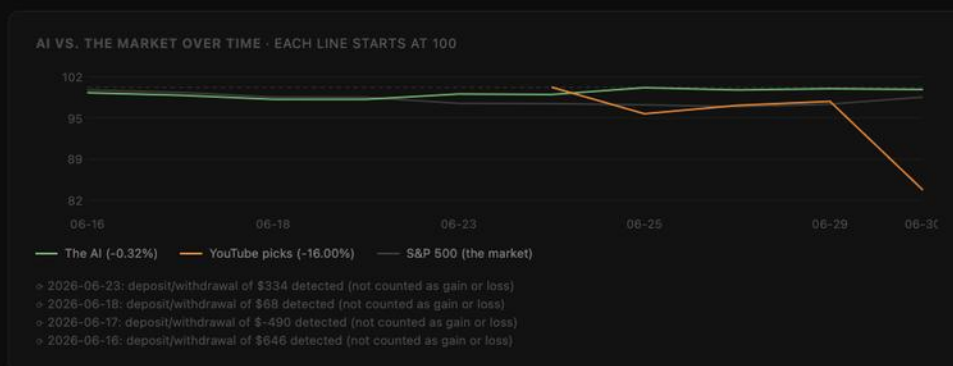

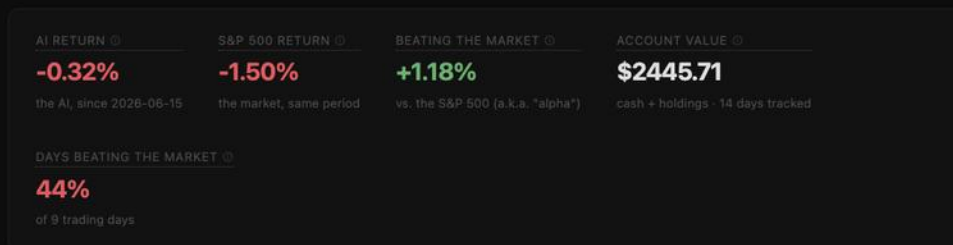

IS IT ACTUALLY WORKING?

It just edged ahead of the S&P

Robinhood Agent

A real-money experiment: an AI agent (Claude) autonomously trades a Robinhood account every weekday and benchmarks itself against the S&P 500.

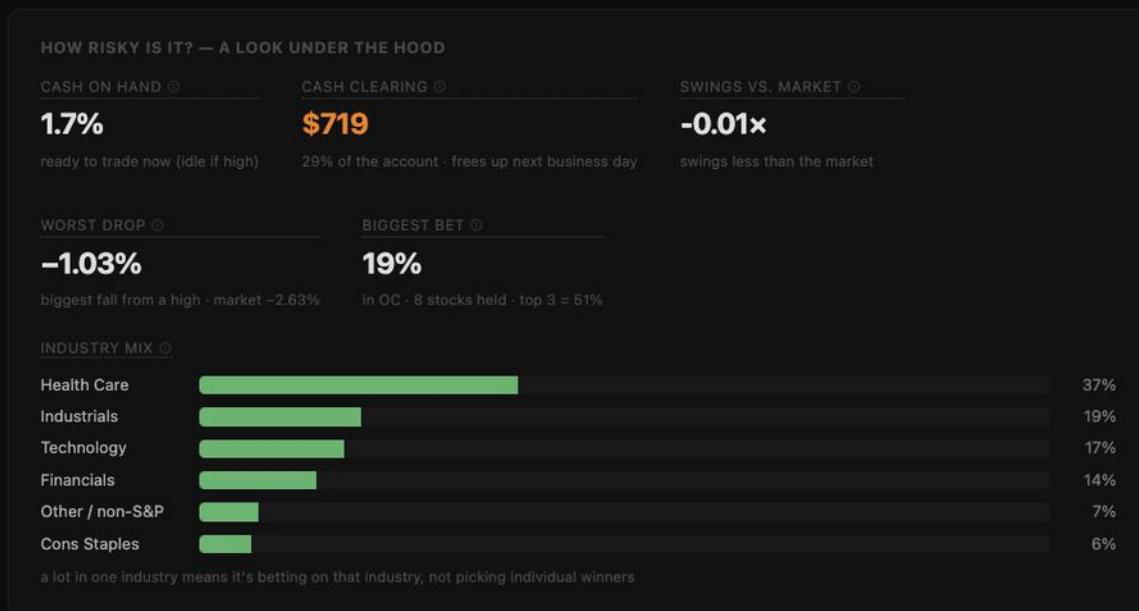

Autonomous AI trading agent · \$2446 total · Trades daily at 7:30am PT · Last run 2026-06-30

+1.18% ahead of the market in the first two weeks – not by big wins, but by losing less when the market pulled back.

MEASURE RISK, NOT RETURNS

The panel a commenter pushed me to build

Beta (it swings less than the market), sector mix, cash drag, drawdown. The panel showed I'm quietly low-beta – it cushions drops: -1.03% worst fall vs the market's -2.63%.

THE LESSON

Deterministic vs. LLM

The LLM “reviewer” kept hallucinating problems that weren’t there.

The boring deterministic checks caught the one bug that actually cost money.

Use LLMs for judgment – never as your source of truth.

Full writeup in the post. What would you build next?
